Open Lubrication Reservoirs

Unfortunately, this can be a normal practice in many manufacturing facilities. A central lubrication reservoir, has a funnel or open top, to make it easier for the person doing the lubricating, to add oil.

As you can see, leaving the top open, can allow the chips, dirt, (contamination) to enter the lube system and begin to cause problems with your equipment uptime. You will not see the problems immediately, but over time will experience many breakdowns due to improper lubrication. We need to train the people servicing the equipment, in lube basics (101).
