See Through Guarding

Hard guarding (wire mesh, etc.) is needed for safety, in many applications to protect the operator or maintenance personnel from parts of the machine that are moving, rotating, etc. They can be painted many colors, including safety yellow. Most of the time they are very difficult to see through. There are some times that you may need to see through them, to view pressure gages, oil levels, etc. One way to be able to look through them, is to install lexan.

Another way, without using hours of labor and lots of money, would be to paint the mesh, a flat black. This allows your eyes to see through the mesh, and focus on what is behind it.

With safety guarding, you can keep the outline in yellow, but still be able to look through the guard itself, to locate potential safety problems and breakdowns in their infancy.
